Dear Datadog Hiring Team,

When I read that this role sits on the People Team, reporting into the Chief of Staff to the Chief People Officer, and is about shaping People programs and infrastructure as systems, I felt genuinely excited. My graduate training in Applied Organizational Psychology taught me to treat organizational challenges as systems to be studied—to diagnose before designing, ask questions before assuming, and build in feedback loops so course correction stays cheap. That is exactly the mindset I want to bring to a People Team operating at Datadog's pace.

For the past two years as a Program Manager at InGenius Prep, I have led 20+ cross-functional programs end-to-end, partnering with global vendors and teams from ideation through delivery and iteration. The work I care most about is the connective part: establishing scalable processes and documentation that let 70+ people across functions move in sync—which cut our onboarding time by 75%—and running needs assessments with 25+ stakeholders so the programs we ship are the ones people actually need. I learned that lesson the hard way once: I rolled out a new process with a full resource library and assumed adoption would follow. It didn't. I went back, interviewed the team, found the real blocker was friction rather than resistance, and rebuilt it as a single landing page. Assumption is the most expensive thing in program work.

The part of your description about synthesizing insights to inform executive-level updates is where I feel most at home. In a manager-effectiveness initiative, I analyzed 2,000+ employee responses, identified the driver that mattered most to engagement, and turned it into a report that reached the C-suite and shaped their strategy—leadership kept referencing those findings even after I left. More recently, through Organization Development Network (ODN) Oregon, I worked with a team of consultants who helped an HR client audit 300+ leave cases, quantify \$362K in costs, and translate that into executive-ready insights that drove real policy redesigns.

I'll be candid: this role asks for more years than I have, and I have not yet owned People programs at the scale of a company Datadog's size. What I can promise is the analytical-meets-human-centered approach behind the numbers above, and a track record of walking into ambiguity and leaving with frameworks. I don't just execute—I ask the right questions, find the root causes, and deliver solutions that stick. As a company building observability for the AI era, Datadog clearly treats complexity as something to be understood rather than merely managed, and that is precisely how I approach the People function: as a strategic lever, not just an operational one.

Thank you for reading. I would love the chance to show how a systems-minded, data-driven approach to People programs could contribute to Datadog's next stage of growth.

Sincerely,

Jamie Cheng
