Dear Sandisk People Operations Team,

The People Operations & Employee Lifecycle Specialist role caught my attention because it is built around the work I most enjoy: taking the messy, manual realities of the employee lifecycle and turning them into clean, standardized, audit-ready processes. As someone with a master's in Applied Organizational Psychology and a few years spent redesigning how People operations actually run, I was drawn to a team that treats hiring, onboarding, changes, and offboarding as a system to be designed and continuously improved—at the company that calls itself the beating heart of the digital world.

Process design and documentation are the core of my day-to-day. At InGenius Prep, I redesigned and standardized manual operational processes and built the SOPs, process documentation, and a self-service knowledge base for 70+ cross-functional staff—work that reduced onboarding time by 75%. I run that work end-to-end across 20+ concurrent initiatives and 25+ stakeholders, and I increasingly use AI and automation to eliminate the manual steps that don't need a human. At Vestas Wind Systems, I optimized onboarding across three global locations through process analysis, supported employee relations and offboarding cases in compliance with local labor laws, and helped direct an M&A project that involved migrating and merging employee records—so the full lifecycle, including its compliance and change-management edges, is familiar ground.

I want to be candid about fit on the systems side. The posting asks for 5+ years of deep Workday and ServiceNow functional and configuration expertise; I have roughly three years in People Operations and have worked in HRIS platforms (SAP, Rippling, ADP) at the user level rather than as a systems administrator. What I bring instead is the process-engineering layer the role centers on—formal process mapping, standardization, and the data-driven diagnosis that decides what a workflow should do before it's built into a tool. In a pro bono OD engagement, I facilitated CEO and HR discovery interviews and analyzed 300+ leave cases to surface \$362K in costs that drove concrete policy redesigns. I learn systems quickly and would close the Workday and ServiceNow depth gap deliberately, but I'd rather you know exactly where I stand than overstate it.

What excites me about Sandisk specifically is the scale and the operational-excellence mindset—two Lighthouse-recognized facilities and a global workforce mean lifecycle processes have to be genuinely standardized, compliant, and measurable, not improvised location by location. That is precisely the kind of problem I like to sit with: diagnose the real friction, design the workflow, document it so it scales, and measure whether it actually worked. I would welcome the chance to bring that discipline to your People Operations team. I should also note, in fairness, that I would require visa sponsorship.

Warm regards,

Jamie Cheng
