Dear ElevenLabs People Team,

There aren't many companies where "no job titles" and "AI first" aren't just culture-deck lines—they're operating principles that reshape how every function works. That combination is what drew me to ElevenLabs' People Operations role. I want to be part of a team that actually uses AI to move faster and at higher quality, not one that talks about it while the onboarding checklist still lives in someone's inbox.

My day-to-day at InGenius Prep is closest to what you're describing: I own the full operational layer for 70+ cross-functional staff—building SOPs, guides, and a self-service knowledge base that cut onboarding time by 75%, and redesigning manual workflows with AI tools and feedback analysis so processes stay current as the team scales. I also manage 20+ concurrent initiatives and multiple vendor relationships, which means I spend a lot of time keeping data accurate, priorities clear, and handoffs clean. That kind of structured, detail-oriented people work is where I'm most useful.

I've also worked directly on the employee lifecycle from both ends. At Vestas, I supported onboarding across three global locations and assisted with employee relations cases, making sure compliance and confidentiality were handled carefully. At ODN Oregon, I analyzed 300+ leave cases, surfaced \$362K in costs, and helped translate data into policy redesigns—which is exactly the kind of work that sits at the intersection of accurate HRIS data and meaningful operational change. ElevenLabs runs HiBob and Deel; I've worked with SAP, Rippling, and ADP, and I pick up new HRIS platforms quickly because the underlying logic is familiar.

What I appreciate most about how ElevenLabs describes this role is the expectation to continuously improve and automate—not as a stretch goal, but as a baseline. That's how I already approach People Ops work. When I see a recurring manual task, my first instinct is to figure out how to eliminate it. I think that mindset fits well in an AI-first culture where impact matters more than process for its own sake, and I'm genuinely excited to bring it to a team doing work at this scale.

Warm regards,

Jamie Cheng
